## 7.127 Image Quality Index

Primitives for computing the image quality index of two images.

### QualityIndex

Given two images  $M$  and  $N$  (both  $W \times H$ ), the mathematical formula to calculate the image quality index  $Q$  between them is expressed as:

$$Q = \frac{4\sigma_{MN}\tilde{M}\tilde{N}}{[(\tilde{M}^2) + (\tilde{N}^2)][(\sigma_M)^2 + (\sigma_N)^2]}$$

where

$$\tilde{M} = \frac{1}{W \cdot H} \sum_{j=0}^{H-1} \sum_{i=0}^{W-1} M(j, i)$$

$$\tilde{N} = \frac{1}{W \cdot H} \sum_{j=0}^{H-1} \sum_{i=0}^{W-1} N(j, i)$$

$$\sigma_M = \sqrt{\frac{1}{W \cdot H - 1} \sum_{j=0}^{H-1} \sum_{i=0}^{W-1} [M(j, i) - \tilde{M}]^2}$$

$$\sigma_N = \sqrt{\frac{1}{W \cdot H - 1} \sum_{j=0}^{H-1} \sum_{i=0}^{W-1} [N(j, i) - \tilde{N}]^2}$$

$$\sigma_{MN} = \frac{1}{W \cdot H - 1} \sum_{j=0}^{H-1} \sum_{i=0}^{W-1} [M(j, i) - \tilde{M}][N(j, i) - \tilde{N}]$$

The functions require additional scratch buffer for computations.

### 7.128.1 Detailed Description

Primitives for computing the maximum error between two images.

Given two images *pSrc1* and *pSrc2* both with width *W* and height *H*, the maximum error is defined as the largest absolute difference between pixels of two images. If the image is in complex format, the absolute value of the complex number is provided.

## 7.129.1 Detailed Description

Primitives for computing the average error between two images.

Given two images *pSrc1* and *pSrc2* both with width *W* and height *H*, the average error is defined as:

$$AverageError = \frac{1}{W \cdot H \cdot N} \sum_{n=0}^{N-1} \sum_{j=0}^{H-1} \sum_{i=0}^{W-1} |pSrc1(j, i) - pSrc2(j, i)|$$

where *N* stands for the number of channels. If the image is in complex format, the absolute value is used for computation.

### 7.130.1 Detailed Description

Primitives for computing the maximum relative error between two images.

Given two images  $pSrc1$  and  $pSrc2$  both with width  $W$  and height  $H$ , the maximum relative error is defined as:

$$MaximumRelativeError = \max \frac{|pSrc1(j, i) - pSrc2(j, i)|}{\max(|pSrc1(j, i)|, |pSrc2(j, i)|)}$$

If the image is in complex format, the absolute value is used for computation. For multiple channels, the maximum relative error of all the channels is returned.

### 7.131.1 Detailed Description

Primitives for computing the average relative error between two images.

Given two images  $pSrc1$  and  $pSrc2$  both with width  $W$  and height  $H$ , the maximum relative error is defined as:

$$AverageRelativeError = \frac{1}{W \cdot H \cdot N} \sum_{n=0}^{N-1} \sum_{j=0}^{H-1} \sum_{i=0}^{W-1} \frac{|pSrc1(j, i) - pSrc2(j, i)|}{\max(|pSrc1(j, i)|, |pSrc2(j, i)|)}$$

where  $N$  is the number of channels. If the image is in complex format, the absolute value is used for computation.

## 7.132 Memory Management

Routines for allocating and deallocating pitched image storage.

### Functions

- void [nppiFree](#) (void \*pData)  
*Free method for any 2D allocated memory.*

### Image Memory Allocation

ImageAllocator methods for 2D arrays of data.

The allocators have width and height parameters to specify the size of the image data being allocated. They return a pointer to the newly created memory and return the numbers of bytes between successive lines.

If the memory allocation failed due to lack of free device memory or device memory fragmentation the routine returns 0.

All allocators return memory with line strides that are beneficial for performance. It is not mandatory to use these allocators. Any valid CUDA device-memory pointers can be used by the NPP primitives and there are no restrictions on line strides.

### 7.132.1 Detailed Description

Routines for allocating and deallocating pitched image storage.

These methods are provided for convenience. They allocate memory that may contain additional padding bytes at the end of each line of pixels. Though padding is not necessary for any of the NPP image-processing primitives to work correctly, its absence may cause severe performance degradation compared to properly padded images.

### 7.135.1 Detailed Description

Compare the pixels of two images and create a binary result image.

In case of multi-channel image types, the condition must be fulfilled for all channels, otherwise the comparison is considered false. The "binary" result image is of type 8u\_C1. False is represented by 0, true by NPP\_MAX\_8U.

### 7.200.1 Detailed Description

Primitives for computing the maximum error between two signals.

Given two signals *pSrc1* and *pSrc2* both with length *N*, the maximum error is defined as the largest absolute difference between the corresponding elements of two signals.

If the signal is in complex format, the absolute value of the complex number is used.

### 7.201.1 Detailed Description

Primitives for computing the Average error between two signals.

Given two signals  $pSrc1$  and  $pSrc2$  both with length  $N$ , the average error is defined as

$$AverageError = \frac{1}{N} \sum_{n=0}^{N-1} |pSrc1(n) - pSrc2(n)|$$

If the signal is in complex format, the absolute value of the complex number is used.

### 7.202.1 Detailed Description

Primitives for computing the MaximumRelative error between two signals.

Given two signals *pSrc1* and *pSrc2* both with length *N*, the maximum relative error is defined as

$$\text{MaximumRelativeError} = \max \frac{|pSrc1(n) - pSrc2(n)|}{\max(|pSrc1(n)|, |pSrc2(n)|)}$$

If the signal is in complex format, the absolute value of the complex number is used.

### 7.203.1 Detailed Description

Primitives for computing the AverageRelative error between two signals.

Given two signals  $pSrc1$  and  $pSrc2$  both with length  $N$ , the average relative error is defined as

$$AverageRelativeError = \frac{1}{N} \sum_{n=0}^{N-1} \frac{|pSrc1(n) - pSrc2(n)|}{\max(|pSrc1(n)|, |pSrc2(n)|)}$$

If the signal is in complex format, the absolute value of the complex number is used.

### 7.205.1 Detailed Description

Signal-allocator methods for allocating 1D arrays of data in device memory.

All allocators have size parameters to specify the size of the signal (1D array) being allocated.

The allocator methods return a pointer to the newly allocated memory of appropriate type. If device-memory allocation is not possible due to resource constraints the allocators return 0 (i.e. NULL pointer).

All signal allocators allocate memory aligned such that it is beneficial to the performance of the majority of the signal-processing primitives. It is no mandatory however to use these allocators. Any valid CUDA device-memory pointers can be passed to NPP primitives.
